Reg. No. : .....

Name : .....

## Second Semester M.Sc. Degree (Regular) Examination, March 2018 MATHEMATICS (2017 Admn.)

## MAT 2C 06 : Advanced Abstract Algebra

Time : 3 Hours

Max. Marks : 80

#### PART - A

Answer any 4 questions. Each question carries 4 marks.

- 1. Give an example of a principal ideal domain. Justify your claim.
- Prove that if N is a multiplicative norm on an integral domain D, then N(u) = 1 for every unit u in D.
- 3. Prove that these exist algebraic extensions which are not finite extensions.
- 4. Prove that every finite field is an algebraic extension of  $\mathbb{Z}_p$  for some prime p.
- 5. Find all isomorphisms of  $\mathbb{Q}(3\sqrt{2})$  onto a subfield of  $\overline{\mathbb{Q}}$ . Which of them are

automorphisms?

 If f(x) ∈ Q [x] is irreducible over Q, prove that all zeros of f(x) have multiplicity one. (4×4=16)

#### PART - B

Answer 4 questions without omitting any Unit. Each question carries 16 marks.

#### Unit – I

| 7. | Pro<br>fac | ove that if D is a unique factorization domain, then D[x] is also a unique<br>ctorization domain.                                                                                     | 16   |
|----|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------|
| 8. | a)         | Prove that if F is a field and x and y are indeterminates, then $F[x, y]$ is not a PID.                                                                                               | 5    |
|    | -          | Prove that if D is a PID, then any two non-zero elements a and b in D. Gave a gcd and that any gcd of a and b can be expressed as $\lambda a + \mu b$ for some $\lambda, \mu \in D$ . | 7    |
|    | c)         | Find all the units in $\mathbb{Z}\left[\sqrt{-5}\right]$ .                                                                                                                            | 4    |
| 9. | a)         | What is $\mathbb{Z}[i]$ ? Prove that $\mathbb{Z}[i]$ is a Euclidean domain.                                                                                                           | 12   |
|    | b)         | State Kronecker's theorem. How would you construct an extension field of $\mathbb{Q}$ contain a root of the polynomial $x^3 + 2x^2 + 4x + 6$ ?                                        | 4    |
|    |            |                                                                                                                                                                                       | T O. |
